

Clean proxy features $\varphi(s_t)$
simulator, noiseless ($\varepsilon = 0$) during training

Noise scale $c \in \{0, 0.5\times, 1\times, 2\times\}$

Eval-time injection (VI-E only):
$$o_i = \varphi(s_t) + c \cdot \varepsilon$$

 ε from the per-feature modes in Table...

Perturbed observation $o_i \rightarrow$ actor π_θ

Degradation curve: metric
vs noise scale c
